                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents the prostate gene PS108-specific expressed sequence tag (EST) consensus sequence. The sequence was produced from overlapping PS108 ESTs sequences to produce a full length consensus sequence. This sequence antibodies to produce PS108 polypeptides which are useful in assays for detecting antibodies to prostate tissue, and as immunogens to produce antibodies. The polypeptide is useful for screening compounds which specifically bind to the polypeptide and for screening for drugs, compounds with PS108. The antibody is useful for detecting an image localisation of, PS108 antigen in a patient, for detecting or disposate as well as for diagnostic tests and for screening for therapeutic agents as well as for diagnostic tests and for screening for disposate or condition, as delivery agents for therapeutic agents as well as for diagnostic tests and for screening for disposate or conditions associated with PS108, especially cancer. The antibody is also useful for generating chimeric antibodies for therapeutic use, for inhibiting the biological activity of PS108, in therapeutic use, for that prostate tissue disease including prostate cancer and its metastases), and to detect the presence of any polypeptide in a test ample which shares one or more antigenic determinants with the PS108
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GGGGCTGTACCAGGCGTGCCCAGAGCTGAGCCGGGCACGAGGCCCGGAGACACTATGA 1236

                                                                                                                                                                   The present invention is related to a number of partial coding and protein sequences for the human prostate tissue protein PS108. These sequences can be used in the diagnosis and prognosis of prostate diseases, particularly prostate cancer. They can also be used to prod antibodies which can be used in treatment. The present sequence is on of the PS108 partial coding sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence represents the coding sequence of prostate gene PS108-specific expressed sequence tag (EST) cDNA clone 171146IH. The sequence was used along with other overlapping cDNA clones to produce a full length consensus sequence (see AASO7155). This sequence could then be used to produce PS108 polypeptides which are useful in assays for detecting antibodies to prostate tissue, and as immunogens to produce antibodies. The polypeptide and for screening compounds which specifically bind to the polypeptide and for screening for drugs, compounds, or any other agent which can be used to treat diseases associated with PS108. The antibody is useful to detect, or for image
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Prostate; PS108; Immunogen; drug screening; image localisation; diagnostic; therapeutic; prostate tissue disease; cancer; metastasis; expressed sequence tag; EST; ss.

localisation of PSIOB antigen in a patient, for detecting or diagnosing a disease or condition, as delivery agents for therapeutic agents as well as for diagnostic tests and for screening for diseases or conditions as sociated with PSIOB, especially cancer. The antibody is also useful for generating chimeric antibodies for therapeutic use, for inhibiting the biological activity of PSIOB, in therapy (for e.g. to treat prostate tissue disease including prostate cancer and its metastases), and to detect the presence of any polypeptide in a test sample which shares one or more antigenic determinants with the PSIOB polypeptide. 88888888888888

expression level in a tissue or at least one mast cell of (I), is useful for presenting information to identify the relative expression level of (I). (II) is used as a marker to detect, disgnose or identify an allergic response in a patient. The protein can also serve as a target that modulate gene expression or activity and as an antigen to raise polyclonal or monoclonal antibodies. (II) is useful for identifying agents that modulate expression of the protein or agents, such as agents that modulate expression of the protein or agents, such as modulating biological activity and function of (II) and thus are useful for identifying a light and a such as allergic hypersensitivity,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2009
                                                                                                                                                                                                                                                                           The invention relates to isolated prostate-specific polypeptides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding of cancer especially prostate cancer. The polypeptides, polynucleotides and polynucleotide and/or polypeptide are useful for stimulating the development polynucleotide and/or polypeptide are useful for stimulating an immune response, and for transling cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ï

prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and tibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies of (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can be used to improve diagnostic and therapeutic mathods for can also be used to improve diagnostic and therapeutic.

methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.

These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a cDNA described in the invention.

The invention relates to isolated nucleic acid (ABNB1319-ABNB1324),

corresponding to genes differentially expressed in mast cells following
activation or in patients with allergic hypersensitivity disease, (I)
that encodes proteins (ABB77569-ABB77575) (II) or a protein fragment of

(II) if at least 6 amino acids. (II) is useful for identifying binding

comparison of (II) is useful for diagnosing or treating a disease

state (e.g. allergic hypersensitivity, seasonal rhinitis, asthma,

utticaria or atopic dermatitis or mastocytosis) in a subject which
involves determining the level of expression of (I) or (II). A computer

comprising a database containing information identifying the
expression level in a tissue or at least one mast cell of (I), is useful

compresenting information to identify the relative expression level of

comparison as marker to detect, diagnose or identify an allergic

comparison a patient. The protein can also serve as a target that

modulate gene expression a cattudyty and as an antigen to raise

contained.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               agents that modulate expression of the protein or agents, such as agonists or antagonists. The agonists or antagonists are useful for modulating biological activity and function of (II) and thus are for alleviating disease conditions such as allergic hypersensitivity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           seasonal rhinitis, asthma, urticaria, atopic dermatitis or mastocytosis.
                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated nucleic acids that are differentially expressed in mast cells in patients with allergic hypersensitivity, encoding proteins associated with mast cell regranulation and allergic hypersensitivity

       A claimed method
protein of interest, in this case P501S(aa55-553). A claimed metho of producing a recombinant protein of interest involves: culturing a host cell (preferably E. col1) under conditions which allow for co-expression of the triple fusion and a ubiquitin-specific endoprotease (especially UBPI from Saccharomyces cerevisiae); and recovering the recombinant protein directly from the bacterial cells after it has been subjected to the action of the ubiquitin-specific endoprotease in vivo. In the present case, a p501-like protein of 509 amino acids is generated. The recombinant protein can used as a vaccine for cancer therapy.
                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           462
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   782
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is that of a triple gene fusion comprising, from the 5' end, the trxA thioredoxin gene from Escherichia coli, from the 5' end, the trxA thioredoxin gene from Escherichia coli, canno acids 1-320) coding sequence, and plan encoding a histidine tail. The triple fusion was constructed in plasmid pRITI5115, cail. The triple fusion mas constructed in plasmid pRITI5115, conder the control of the lambda pL promoter. Triple fusion proteins of protein (see AAM50662) was produced in E. coli G1724 transformants. This is an example of the production of triple fusion proteins of the invention comprising ubiquitin fused between thioredoxin and a protein of interest, in this case F5015(aal-320). A claimed method of protein of interest involves: culturing a host cell (preferably E. coli) under conditions which allow a host cell (preferably E. coli) under conditions which allow condoprotease (especially UBPL from Saccharomyces cerevisiae); and recovering the recombinant protein directly from the bacterial cells after it has been subjected to the action of the cubiquitin-specific endoprotease in vivo. In the present case, expression was controlled by addition of tryptophan. The expression was controlled by addition of tryptophan. The combinant protein can used as a vaccine for cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                       Novel DNA sequence encoding triple fusion protein comprising ubiquitin fused between thioredoxin and polypeptide of interest, useful for producing recombinant polypeptide of interest suitable for medicinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         283 TATGGTCCAGAGGCTGTGGGTGAGCCGCCTGCTGCGGCACCGGAAAGCCCCAGCTCTTGCT

Ambo5220-Aabo5282 represent CDNAs corresponding to 21 human secreted protein genes, and AAE01352-AAE0143 represent the proteins they encode. AAE01413-FAAE0143 represent human secreted proteins they encode. The secreted proteins and their genes are useful for preventing. Treating or ameliorating medical conditions, e.g., by protein or gene therapy. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the amount of the passed on the tissues in which they are most highly expressed, and include the new genes. Specific uses are described for each of the 21 genes, cancer, tumours, foetal and developmental abnormalities. Cancer, tumours, foetal and developmental abnormalities, haematopoletic disorders, diseases of the immune system, AIDS, autoimmung calesases (e.g., rheumatoid arthritis), inflammation, allergies, conditive disorders, disbates, atherosclerosis, cardovascular disorders, copnitive disorders, alabates, atherosclerosis, cardovascular disorders, and progenic disorders, and conditive disorders, independent disorders, and infections. The progenic disorders, independent disorders, and infections. The projection of also before transplantation, for supporting cell culture of primary tissues, correspondent tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or protein of the invention can be used as a food additive or protein of the invention can be used in allevating specific for a protein of the invention can be used in allevating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., the present sequence represents a human secreted protein-encoding cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2394 ATGGGAGTTTCTAGGATGAAAC-ACTCCTCCATGGGATTTGAACATATGACTTATTTGTA 2452

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated prostate-specific polypeptides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding rells specific for a tumour protein, and for inhibiting the development polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for esponse, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I). (II), to antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. To calls prepared using (I) or (II) are used treat cancer in a patient. To patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can be used in vaccines. The antibodies or (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GTCGGCCCCCTCCTTGTCGCCCCACTGCTGTCCATGCCGGGCCCGCTTGGCTTTCCGGAA 1038

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09
                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

bind an immunogenic portion of a prostate protein (such as by this sequence). An antibody which binds to an immunogenic of the prostate protein, and the method can be used to detect, progression of, or treat prostate cancers. The antibody may conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      657

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunogenic portion of a prostate tumour protein (PTP). The polypeptides and polynucleotides encoding them have cytostatic activity and can be used in vaccines and in gene therapy. The polypeptides and polynucleotides encoding them, antigen presenting cells which express the polypeptides and vaccines comprising them can be used for inhibiting the development of prostate cancer in a patient. The polypeptides can be used to generate antibodies or anti-idiotypic antibodies for passive immuno therapy. A portion of the polypeptides can be used as a probe or to modulate the expression of the polypeptides or an be used as a probe or to modulate the expression of the polypeptides. AAA06541 to AAA06691 and AAV82000 to AAX82000 represent sequences used in the exemplification of

polynucleotides, polypeptides, fusion proteins of the polypeptides, darkbodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antigenic epitopes cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for attimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development polynucleotide and/or polypeptide are useful for stimulating an immune response, and for transing cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polynucleotide of the invention.
                                                                                                                                                    New human prostate-specific polypeptides and polynucleotides useful for the diagnosis and treatment of cancer, especially prostate cancer

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sitel: DraIII (CACATGTG)

R. Site2: DraIII (CACATGTG)

Description: 1st strand cDNA was primed with an oligo(dT) primer large strands of the strand cDNA was primed with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTT]; double-stranded cDNA was synthesized using specific 5 and 3 primers and amplified by PCR. The PCR product was digested with Sfil and size selection was performed to product was digested with Sfil and size selection was performed to arclude fragments <1.5kb.The Sfil-digested PCR product was cloned into distinct DraIII sites of pME185-FL3. AhoI sites just outside the DraIII sites can be used to isolate the cDNA insert. Libraries were constructed by oligo-capping method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /translation="MVORLMVSRLRHRKAQLLINLLFGLEVCLAAGITYVPPLLL

Description: 1st strand cDNA was primed with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTTTTTT]; double-stranded cDNA was synthesized using specific 5' and 3' primers and amplified by PCR. The PCR product was digested with Sfil and size selection was performed to exclude fragments <1.5kb.nhe Sfil-digested PCR product was cloned into distinct Draili sites of PME18S-FL3. XhoI sites just outside the Draili sites can be used to isolate the CDNA insert. Libraries
